SOLUTIONS

- **Medical care is estimated to account for only 10-20 percent of the modifiable contributors to healthy outcomes for a population^[1]**
- Health is broader than healthcare
- Healthcare?
 - Medical services provided to maintain or restore health
- What is health?
 - Overall wellbeing
 - Physical
 - Mental
 - Social well-being
- Influenced by lifestyle, environment, genetics and **social determinants**

¹Hood, C. M., K. P. Gennuso, G. R. Swain, and B. B. Catlin. 2016. County health rankings: Relationships between determinant factors and health outcomes. American Journal of Preventive Medicine 50(2):129-135. <https://doi.org/10.1016/j.amepre.2015.08.024>

Illegal levels of air pollution linked to child's death

9 July 2018

By Claire Marshall, BBC Environment Correspondent

Share

Ella wasn't born with asthma

A nine-year-old girl's fatal asthma attack has been linked to illegally high levels of air pollution.

Ella Kissi-Debrah lived 25m (80ft) from London's South Circular Road - a notorious pollution "hotspot".

Measuring Social Determinants

- Index of Multiple Deprivation (IMD)
- Relative composite measure of deprivation in a geographical area
- Social needs are not exclusive to areas of high deprivation

What can we learn about individual social needs from routinely collected healthcare data?

- Can we learn about people's social needs from healthcare data?
- To what extent are these captured?
- How do they relate to the relative deprivation of where people live, their age and their clinical position?
- What is the association with emergency hospitalisation and how might this vary depending on the type of person?

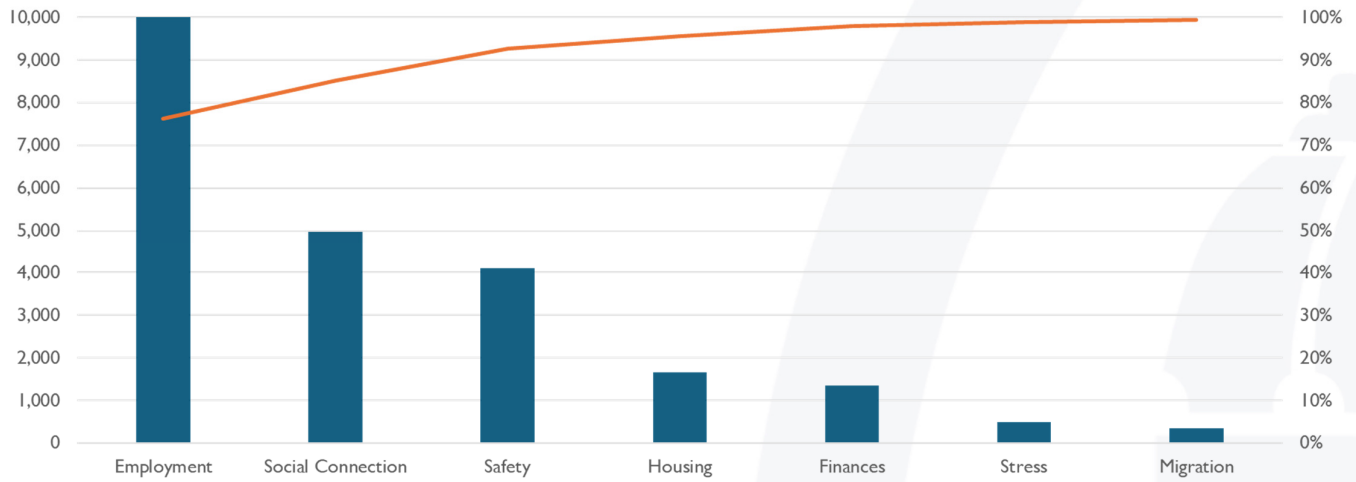

ACG Social Needs Framework

- Social Needs Framework:
 - **Employment**
 - Not medically fit for work or unemployed
 - **Social Connection**
 - Living alone and housebound
 - **Safety**
 - Adult safeguarding, risk of domestic abuse
 - **Housing**
 - Damp/mould in house, homelessness
 - **Finances**
 - Difficulty/unable to manage personal financial activities
 - **Stress**
 - Stress at work, other problems related to life-management difficulty
 - **Migration**
 - Asylum seeker
 - **Nutrition**
 - Undernourished
 - **Education**
 - Unable to read
 - **Incarceration**
 - Recently released from prison
 - **Military**
 - Served in armed forces

Curating a Whole Population Dataset

What we discovered – more social needs captured than expected

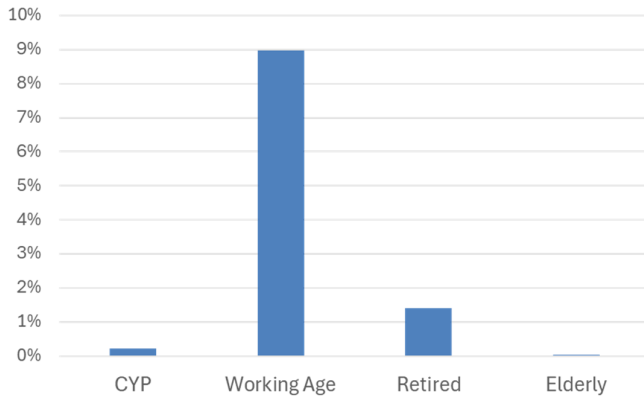

A focus on the impact of employment needs

- 5.5%+ of people had employment needs
- 40,937 (~95%) people identified who have had a Doctor's medical certificate in the past year

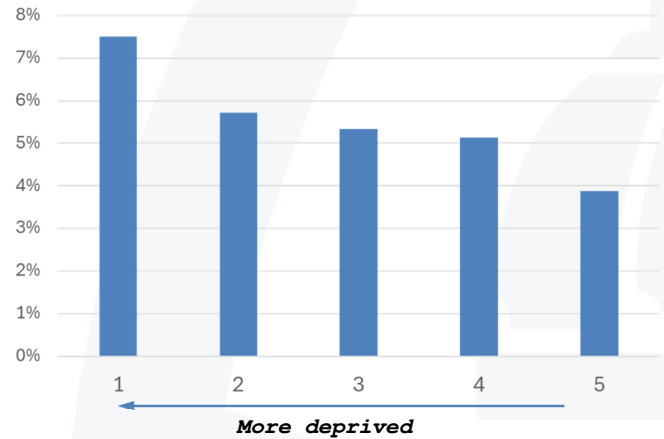

Employment Needs and Age Group

Highest proportion of employment needs in the working age group

Employment Needs and relative deprivation

Highest proportion of employment needs in the most deprived quintile

Employment needs by Patient Need Groups (PNGs)

An innovative segmentation model, applicable to all age groups and the whole population, building upon the ACG System's whole-person approach to measuring health needs.

There are **eleven mutually exclusive segments** that describe an individual's health need based on the diseases and conditions they have.

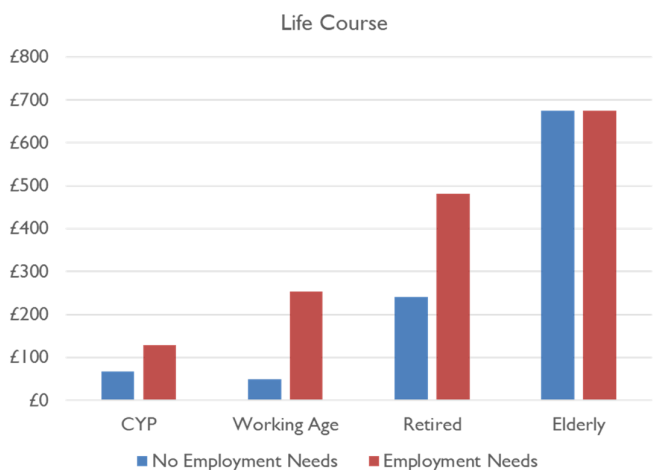

PNGs are clinically coherent and are a 'currency' that is intuitive to understand when considering the overall complexity of an individual.

More people use emergency services who have employment needs

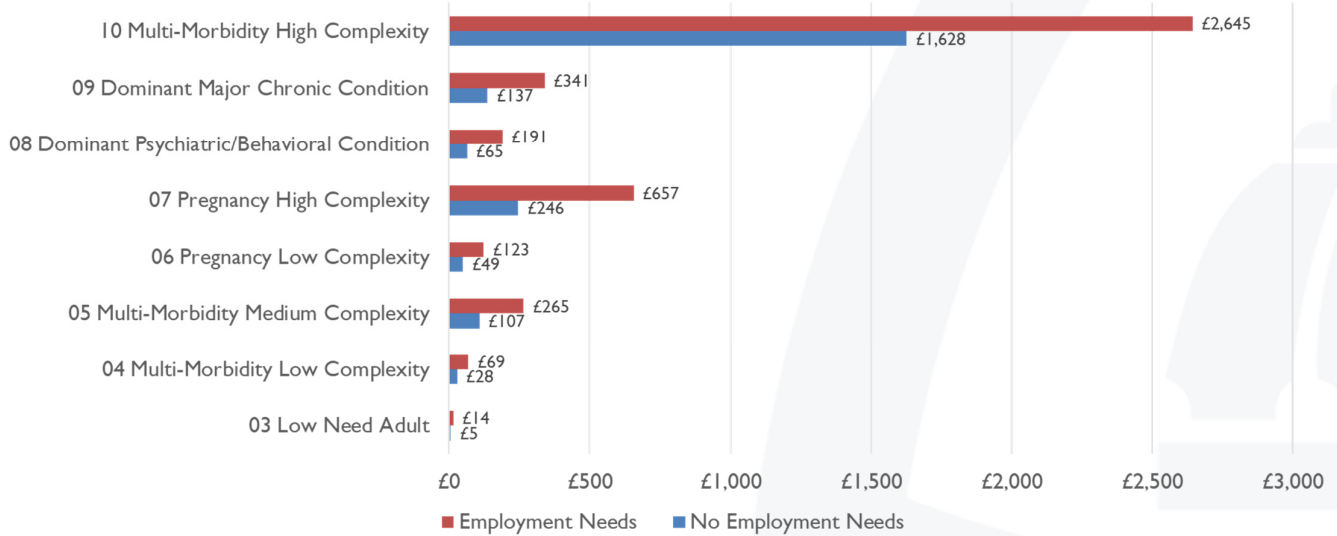

Impact of having employment needs on emergency costs

Most deprived, working age population (n=99K)

Patient Needs Group (PNG)

Isolating the effect of employment needs

Zero hurdle model coefficients (binomial with logit link):

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Being unemployed is associated with a 130%+ increase in emergency admission costs among those with positive costs, after adjusting for age, comorbidities, and deprivation.

Reflections

- Applications:
 - Should this feature as an important variable in case-mix adjustments?
 - Should this augment how services are planned?
 - Could this help create/curate cohort selection?
 - Is this relevant for implementation of new models of support?

Limitations and next steps

- Limitations and future research:
 - These only represent a fraction of all social needs
 - These social needs are only relevant to the clinical consultation
 - Should we leverage more routinely collected datasets from across all the health and care assets?
 - Does this demand an integrated approach to sharing knowledge and formulating solutions?

Conclusions

- Social needs are indeed recorded where relevant to the clinical consultation
- They are varied and represent real world challenges for people
- They have a clear and significant impact on emergency hospital utilisation
- We know they are limited in their scope

Thank you
